Hi ícaro, Im Ricardo Reyes from IAvH - Colombia.

Diogo told me you can help us with the remanufacturing process of CNCFlora to our needs.

Right now we are founding some issues:

After edit the \nuvem\.env

The nuvem is into the application cloud:

We did some editions to the body:

But when we load the service, the portal still in Portuguese.

Inline image 4

That´s the main question: Is something we are forgeting? Or is necessary to chango other parts in the code (same file, or other files too)?

Thank you so much in advance and I will appreciate your help.

Best reggards!!!

PS: Sorry to send you that images, but is for information purposes, hahaha.

Hello Ricardo.

'Portal', as you are trying to access on your server through (192.168.50.200/portal) is a container inside 'nuvem' application.
For development, I would suggest you to clone 'Portal' repository (https://github.com/CNCFlora/Portal) into your pc.

On this link you will find the instructions to install and run it local.
After all the changes you want to improve, for example to change the language, you run on the directory you cloned the repository:

make build push

This command will send to nuvem application all the last changes you made.
Then on your server run:

./restart.sh portal

That will update the image of container 'Portal' on the server.

All these concepts of container and image are well explained on this tutorial about docker(https://docs.docker.com/engine/getstarted/), which I would highly recommed you to take a look.

In any case, please send me your feedback.

Next time I will try to reply to you faster.
Hope I can help you!

Have a good week.
